Facts on American Teens’ Sexual and Reproductive Health

SEXUAL ACTIVITY
• Although only 13% of teens have had sex by age 15, most initiate sex in their later teen years. By their 19th birthday, seven in 10 female and male teens have had intercourse.
• On average, young people have sex for the first time at about age 17, but they do not marry until their mid-20s. This means that young adults may be at increased risk for unintended pregnancy and STIs for nearly a decade or longer.
• Teens are waiting longer to have sex than they did in the recent past. In 2006–2008, some 11% of never-married females aged 15–19 and 14% of never-married males that age had had sex before age 15, compared with 19% and 21%, respectively, in 1995.
• However, after declining substantially between 1995 and 2002, the proportion of teens who had ever had sex did not change significantly from 2002 to 2006–2008.
• In 2006–2010, the most common reason that sexually inexperienced teens gave for not having had sex was that it was “against religion or morals” (38% among females and 31% among males). The second and third most common reasons for females were “don’t want to get pregnant” and “haven’t found the right person yet.”
• Among sexually experienced teens, 70% of females and 56% of males report that their first sexual experience was with a steady partner, while 16% of females and 28% of males report first having sex with someone they had just met or who was just a friend.
• Seven percent of young women aged 18–24 who had had sex before age 20 reported that their first sexual experience was nonvoluntary. Those whose first partner was three or more years their senior were more likely to report this than were other women in the same age-group.
• Teens in the United States and Europe have similar levels of sexual activity. However, European teens are more likely than U.S. teens to use contraceptives generally and to use the most effective methods; they therefore have substantially lower pregnancy rates.

CONTRACEPTIVE USE
• A sexually active teen who does not use a contraceptive has a 90% chance of becoming pregnant within a year.
• The majority of sexually experienced teens (78% of females and 85% of males) used contraceptives the first time they had sex.
• The use of contraceptives during first premarital sex has been increasing, rising from 56% among women whose first

In Brief

Teen Contraceptive Use

Contraceptive use at first premarital sex is increasing.

• Three percent of males and 8% of females aged 18–19 in 2002 reported their sexual orientation as homosexual or bisexual; the proportions reporting same-sex behaviors were similar.
The majority of teen pregnancies end in birth.

- Nearly two million women younger than 20 were served by publicly supported family planning centers in 2005; these teens represented one-quarter of the centers’ contraceptive clients.
- In 2006, only 5% of American high schools made condoms available to students.

**STIs**
- Young people aged 13–24 made up about 17% of all people diagnosed with HIV/AIDS in the United States in 2008.
- Although 15–24-year-olds represent only one-quarter of the sexually active population, they account for nearly half (9.1 million) of the 18.9 million new cases of STIs each year.
- Human papillomavirus (HPV) infections account for about half of STIs diagnosed among 15–24-year-olds each year. HPV is extremely common, often asymptomatic and generally harmless. However, certain types, if left undetected and untreated, can lead to cervical cancer.
- Two HPV vaccines—Gardasil and Cervarix are currently available, and both prevent the types of infections most likely to lead to cervical cancer. The Centers for Disease Control now recommends HPV vaccinations for both girls and boys, starting at age 11.
- In 2009, 44% of females aged 13–19 had received one or more doses of the vaccine against HPV; 27% had completed the recommended three doses.
- All 50 states and the District of Columbia explicitly allow minors to consent to STI services without parental involvement, although 11 states require that a minor be of a certain age (generally 12 or 14) to do so. Thirty-one states explicitly include HIV testing and treatment in the package of STI services to which minors may consent.

**PREGNANCY**
- Each year, almost 750,000 U.S. women aged 15–19 become pregnant. Two-thirds of all teen pregnancies occur among 18–19-year-olds.
- Overall, 68 pregnancies occurred per 1,000 women aged 15–19 in 2008. The 2008 rate was a record low and represented a 42% decline from the peak rate of 117 per 1,000, which occurred in 1990.
- The majority of the decline in teen pregnancy rates in the United States (86%) is due to teens’ improved contraceptive use; the rest is due to increased proportions of teens choosing to delay sexual activity.
- Despite having declined, the U.S. teen pregnancy rate continues to be one of the highest in the developed world. It is more than twice as high as rates in Canada (28 per 1,000 women aged 15–19 in 2006) and Sweden (31 per 1,000).
- In 2008, New Mexico had the highest teenage pregnancy rate (93 per 1,000); rates in Mississippi, Texas, Nevada and Arkansas followed. The lowest rates were in New Hampshire (33 per 1,000), Vermont, Minnesota, North Dakota and Massachusetts followed.
- Eighty-two percent of teen pregnancies are unplanned;
teens account for about one-fifth of all unintended pregnancies annually.

- Fifty-nine percent of pregnancies among 15–19-year-olds in 2008 ended in birth, and 26% in abortion.
- Black and Hispanic women have the highest teen pregnancy rates (117 and 107 per 1,000 women aged 15–19, respectively); non-Hispanic whites have the lowest rate (43 per 1,000).
- The pregnancy rate among black teens decreased 48% between 1990 and 2008, more than the overall U.S. teen pregnancy rate declined during the same period (42%).
- Most female teens report that they would be very upset (58%) or a little upset (29%) if they got pregnant, while the rest report that they would be a little or very pleased.

CHILDBEARING
- Ten percent of all U.S. births are to girls aged 19 or younger.
- Most births to teen mothers are first births. Eighteen percent are second or higher order births.
- The share of births to teen mothers that are nonmarital rose from 79% in 2000 to 86% in 2009. Yet, over the last several decades, the share of all nonmarital births that are to teenagers has been declining, from 52% in 1975 to 21% in 2009.
- In 2009, some 39 births occurred per 1,000 women aged 15–19; this rate marks a 37% decline from the peak rate of 62 reached in 1991.
- Six percent of teen mothers aged 15–19 received late or no prenatal care. Babies born to teens are more likely to be low birth-weight than are those born to women in their 20s and 30s.
- Teen childbearing is associated with reduced educational attainment. Teen mothers are substantially less likely than women who delay childbearing to complete high school or obtain a GED by age 22 (66% vs. 94%). Fewer than 2% of teens who have a baby before age 18 attain a college degree by age 30.

FATHERHOOD
- Most teen males report that they would be very upset (46%) or a little upset (34%) if they got someone pregnant, while the remaining 20% report that they would be pleased or a little pleased.
- Teen fatherhood rates vary considerably by race. In 2006, the rate among black males aged 15–19 who became fathers (34 per 1,000) was more than twice that among whites (15 per 1,000).
- The rate of teen fatherhood declined 25% between 1990 and 2006, from 24 to 18 per 1,000 males aged 15–19. This decline was far more substantial among blacks than among whites (38% vs. 18%).

ABORTION
- Women aged 15–19 had 192,090 abortions in 2008.
- The reasons teens most frequently give for having an abortion are that they are concerned about how having a baby would change their lives, cannot afford a baby now and do not feel mature enough to raise a child.
- As of October 2011, laws in 36 states required that a minor seeking an abortion involve her parents in the decision.
